Hi David,

We spoke briefly. For context:

- I had already sent a proposal to Ben Estates that was identical to this, but it specified a managed service agreement instead of ownership
- I have a signed contract with Sara Grech, with exactly this, but both rental and sales, and this is currently in development, again a manage service contract
- I have a contract (figuratively) on my desk ready to be signed with REAP (leading Real Estate CRM provider) which would be a joined venture together selling this to all their clients - but they put in an exclusivity clause which says I can't implement this with clients that aren't on REAP. I haven't signed yet as I'm still gauging the situation (REAP seems to be losing market share with unhappy clients and the general trend of SaaS being replaced with custom built systems). To be clear however this is not a problem even if I sign - commercials can come through Born.

None of the above is an issue - anzi, it's beneficial.

My only issue here is that they're asking for code ownership and want this as a one-time cost not a managed service. What's their flexibility on this?

- Do they prefer a 350/month engagement that includes everything alongside support, maintenance, SLA, as well as enhancement hours per quarter?
- Or do they prefer a one-time say €6,000 fee, plus say €500/year for SLA and everything (including support) is charged by the hour - higher investment, less recurring fees, but they have ownership?

The above 'estimates' are not just estimates and I can commit to them... but before formally sending a formal committal proposal would like a bit more feedback.

NB: I'm basing this on your email text - the document attached seems internal SOPs and not directly related to the tech part.

Best Regards,

**Matthew Galea**

Matt,

Afternoon - hope you're well.

We're preparing a proposal for QuickLets to automate WhatsApp outreach to property owners to confirm rental availability and sync the outcomes back into QuickLets' CRM. This will replace today's manual agent-led outreach, particularly for properties with stale information.

Can you kindly provide us with a quote for the work from your side?

Below is a summary of the requirements, and I am also attaching the specification document from their side in case you need the full details. Please feel free to call me if you have any questions.

### Core components

#### 1. AI Agent (conversational)

- Initiates outreach based on configurable triggers, primarily stale listings (no trusted confirmation within the freshness window) and manual triggers from authorised agents. To avoid over-messaging owners, outreach runs only after any internal verification path defined by QuickLets (e.g. a task to the listing agent) has been exhausted.
- Loads property and owner context from the CRM via an API, opens with a pre-approved WhatsApp template, and runs a short natural conversation in English.
- Needs a finite-state flow (greeting, question, clarification, confirmation, close) and an NLU layer that maps free-text replies to a defined set of structured outcomes: available now, not available, available from a future date (with the date captured in DD/MM/YYYY), conditions changed, no reply, or escalate. Outcomes outside this set are never inferred - they are escalated.

- Follows a configurable reminder cadence where the owner doesn't reply (typically first reminder after 24-48h, optional second), then closes as 'no reply'.
- Flags conflicts where the owner's reply materially contradicts the current CRM state, routing them for manual review rather than silently overwriting.
- Out-of-scope or ambiguous conversations raise a ticket back to QuickLets with full context attached.

## 2. CRM integration via API

- Reads property records, owner contact details, last known status, and operational flags.
- Writes back structured updates against the correct property and owner records, including:
  - Availability status (available / not available / available later / no reply)
  - Available-from date where a future date was captured
  - Any changed fields (price, conditions, viewing windows)
  - Source of the update (recorded as 'Owner WhatsApp' so QuickLets' confidence model can treat the record as directly owner-confirmed)
  - Timestamp (supports freshness and confirmation-age calculations)
  - Attempt count and last contact attempt date
  - Full conversation transcript for audit
- Writes must be fully audit-logged and idempotent, with clear lineage back to the conversation that produced them.
- Prefer structured/custom fields over free-text notes where the CRM exposes them.
- The AI Agent populates the data points that power QuickLets' availability trust model; defining the statuses, calculating confidence tiers, and enforcing visibility rules sit on the CRM side and are out-of-scope.
- Notes:
  - CRM is a custom build they built a couple of years ago and which they maintain themselves.
  - The CRM does not have APIs yet, and they will have to build it for this case - out-of-scope for our engagement.
  - Similarly, any customisations to the CRM (UI changes, role-based visibility rules, restriction flags, confidence calculations, dashboards, badges, KPI scorecards, owner self-service portal) are out-of-scope.

## 3. WhatsApp integration

- Via a QuickLets-owned verified WhatsApp Business Account.
- The integration with WhatsApp can be through the Meta API directly or via a provider, like Twilio or Vonage.
- Outbound messages outside the 24-hour service window use pre-approved templates; template content, language, and category to be agreed during Design and submitted to Meta for approval before go-live.
- WhatsApp messaging fees are billed directly by Meta to QuickLets' Business Account and are not included in our pricing.

## Hosting

- System runs inside QuickLets' own environment, alongside their CRM (no cross-environment data transfer).
- We are then given operational access to deploy, monitor, and maintain.
- QuickLets owns the infrastructure.
- So, no hosting costs, however all model costs still apply.

## Security and compliance

- Standard security practices like encryption of data in transit (TLS 1.2+), encryption at rest (AES-256), role-based access control, audit logs, secrets management, etc.
- Compliance with GDPR and EU AI Act required.
- Complete audit trail: every conversation and every CRM write logged immutably.

## Volume

- Last year they logged 500k outreaches in their CRM, covering all outgoing calls across all purposes.
- The system will primarily handle stale properties, which represent a small portion of these calls. Unfortunately, they don't have reliable data to help us accurately size the volume.
- I'd suggest working with a rough assumption of 10% (equivalent to ~5k conversations per month) of outgoing outreaches, and we can build this into the contract to protect our pricing — base fee covers up to an agreed monthly cap, with per-conversation overage above that, reviewed quarterly against actual usage.
- P.S. A 'conversation' here refers to a series of interactions forming a single exchange, not individual messages.

## Term

- 2 years
- After this period, QuickLets can opt to take over the management of the solution, or else engage us for ongoing maintenance
